Dear Dr. Steenhuis,

I had a close look at your manuscript as well as at the two reviews. Both reviewers raised major points that should be addressed within the revised version of this manuscript. I in particular agree that the question of model structural uncertainty should be discussed in the new version and that a verification of the calibrated extend of sediment source areas with independent data would strongly increase the credibility that the model works for the right reasons.
Additionally I think it is necessary to explain how the proposed model structure can help to quantify the effect of land management practice on soil loess.

Best regards,

Erwin Zehe
