Simulated values correspond to median of the annual estimates calculated for the historical time-period 1966-1995. The colours of the dots denote the five GCMs used to drive the HMs. The map shows the spatial distribution of the relative bias between historical measurements and GCM-HM simulations.

**Interactive comment on** “Climate change alters low flows in Europe under a 1.5, 2, and 3 degree global warming” by Andreas Marx et al.
