Only 45% of households in Indonesia can access adequate drinking water. This figure is still half of the 2015 Millennium Development Goals (MDGs), where the Indonesian population (86.9%) must be able to access clean and healthy drinking water. This condition contributes to one hundred thousand Indonesian children who die from diarrhea every year. "This is made worse by the presence of global warming which threatens to decrease the quality and quantity of clean water," News: http://www.unair.ac.id/global-warming-ancam-ketersediaan-berita_1314.html
